# CONTENTS

Below is a short description of what I'm using for this project and what to expect from it. As per instructions, I will make sure MySQL is used in the project.

01	Medical Patient Management
02	Powered By Node.js
03	Frontend with React
04	Backend using Express
05	Database MySQL

# DESCRIPTION

In this project, I will try to keep a record of info about patients, their issues, costs, status and their doctors using relational database and show them to logged in staff.

## Key Features:

- Maintain a login system to protect data from public access
- Create, save and manage patient info such as Name, Patient ID, Age, Gender, Disease and etc.
- Logged in staff can also assign a doctor to a patient from the list of available of doctors after analyzing patient's issue.
- Staff can also assign estimated cost of diagnosis to a certain patient which can also be used to filter patient list along with other attributes.
